

AI Workflow Audit and Tool Setup

FL-01 — General AI Fluency, Week 1

Abdul Salam

Backend & AI Systems Engineer

Why This Audit Matters

You cannot improve a workflow you have never mapped. Before deciding where AI genuinely helps, where it wastes time, and where it should never be trusted, the actual week has to be written down honestly, task by task, rather than described in general terms.

The classification below follows Ethan Mollick's task-based framework: for each recurring task, decide whether it is something done alone, something delegated to AI with review before it's trusted, something done collaboratively with AI in the loop throughout, or something fully automated end to end.

Two tasks below are deliberately marked “just me” with an honest reason, not because AI couldn't technically help, but because the judgment involved (financial decisions, resume claims, application prioritization) shouldn't be outsourced even partially.

The Workflow Audit

10 to 15 recurring tasks from a real week — study, work, and side projects.

#	Task	Classification	Rationale
1	Writing FlyRank assignment code (FastAPI, Docker, Celery)	Collaborate with AI	Need to understand every line for interviews. AI accelerates the build, but I drive every architecture decision.
2	Debugging git/GitHub push and Docker errors	Collaborate with AI	Error messages are specific enough that AI speeds up diagnosis, but I run and verify every command myself.
3	Writing assignment READMEs	Delegate to AI with review	Structure is repeatable across assignments. I review for accuracy (correct filenames, real output) before submitting.
4	Taking and organizing submission screenshots	Just me	Purely manual capture and file management, no AI step involved.
5	Writing LinkedIn posts about my work	Collaborate with AI	AI drafts, but tone, voice, and final wording are mine. I've corrected AI overclaiming in past drafts.
6	Job application cover letters	Delegate to AI with review	Template-driven, but I check every claim stays honest (60/70 percent Django framing, no overstatement).
7	Nolyth bootcamp sprint tasks	Collaborate with AI	Same reasoning as FlyRank: I need deep understanding of the code, not just a working submission.
8	Resume and CV updates	Just me	Too easy to overclaim by accident. I write and edit this one myself, deliberately, without AI drafting it first.
9	Technical interview preparation (Q&A practice)	Collaborate with AI	AI generates practice questions and explanations; the actual learning and recall is mine.
10	Tracking job applications and responses	Just me	Needs personal judgment on prioritization and timing that I don't want to hand off.
11	Scoping new portfolio project ideas	Collaborate with AI	AI helps map out feasibility and scope quickly; I decide what's actually worth building and why.
12	Checking and timing crypto trade positions	Just me	Financial decisions with real money. No AI involvement, by choice.

Toolkit Setup

Free accounts created:

- Claude (claude.ai) — primary assistant for code, documentation, and structured writing.
- ChatGPT (chatgpt.com) — secondary cross-check for drafts and quick fact-checking.
- Anthropic Academy — enrolled in AI Fluency: Framework & Foundations, first module completed.

Claude Project — Custom Instructions

A dedicated Claude Project was created for FlyRank and Nolyth work, with the following custom instructions saved so every new chat in this Project starts with the right context automatically:

Who I am: Abdul Salam, BSCS graduate (AI-focused), currently a Backend AI Engineering intern at FlyRank AI and a participant in Nolyth's Associate AI Engineer training program. I self-identify as roughly 60-70 percent Django/Python backend engineer and 30-40 percent AI integration — please don't reframe this ratio without me saying so.

Tone preferences: direct, no over-explanation, no em dashes, no AI-sounding symbols in anything meant to be posted publicly. Honest about skill gaps, never overclaiming.

Current goals: complete FlyRank assignments to a real production standard (tested, documented, screenshot-proven), build a credible technical portfolio, and land a paid Backend AI Engineering role, priority order Lahore onsite, then Islamabad, then remote worldwide.

[Insert your own screenshot of the configured Claude Project here before submitting — this page is a placeholder for that image.]

Three Target Tasks for FL-02 through FL-04

These three tasks recur every week and will be reused across the next three assignments. Each has a specific, measurable definition of what “done well” means, so progress on the same task can actually be compared week to week.

1. Coding assignment implementation

Classification: Collaborate with AI

Done well means: Every stage tested with real terminal output (not fabricated), code matches the exact interface/architecture required, work committed in meaningful stage-by-stage commits, and the README documents run instructions plus genuine screenshots that render correctly on GitHub.

2. Assignment documentation (READMEs)

Classification: Delegate to AI with review

Done well means: Filenames in the README match the actual files in the repo exactly (no broken image links), terminal output quoted is real output actually produced, and the document explains the reasoning behind decisions, not just what was built.

3. Public technical writing (LinkedIn posts)

Classification: Collaborate with AI

Done well means: No em dashes, no AI-sounding symbols, specific technical detail rather than generic claims, and the 60/70 Django-to-AI ratio stays honest rather than drifting toward overclaiming AI expertise.
